Search completed: October 9, 2002, 09:06:33 Job time : 6.98595 secs

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A.Accession: C34448
A.Molecule type: protein
A.Residues: 308-314, 1x, 16-329 CBRZ>
C.Comment: In this protein, the coiled-coil rod-like region found in many myosin heavy he protein is globular and does not self-associate into filaments.

941Cine-rich RNA-binding protein. RGP-la - wood tobacco
C;Species: Nicotiana sylvestris (wood tobacco)
C;Date: 25-Dec:1994 #sequence_revision 01-Dec-1995 #text_change 20-Jun-2000
C;Accession: S41771
R;Hirose, T; Sugita, M; Sugiura, M.
Nucleic Acids Res. 21, 3981-3987, 1993
A;Title: CDNA structure, expression and nucleic acid-binding properties of three RNA-A;Reference number: S41771; MUID:93382772
A;Molecule type: mRNA
A;Residues: 1-156 CHIR>
A;Nolecule type: RMB-D16204; NID:9436789; PIDN:BAA03741.1; PID:9469070
C;Superfamily: glycine-rich RNA-binding protein; ribonucleoprotein repeat homology
F;7-74/Domain: ribonucleoprotein repeat homology <RRNI>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       R.D'Esposito, M.; Morelli, F.; Acampora, D.; Migliaccio, E.; Simeone, A.; Boncinelli,

RT Acanthamceba myosins I. An improved method for locating the canthamceba myosins I. An improved method for locating the canthamceba myosins I. An improved method for locating the canthamceba myosins I. A PROTEIN THAT BINDS TO F-ACTIN E HAS ATPASE C. I. FUNCTION: MYOSIN IS A PROTEIN THAT BINDS IN SINGLE-HEADED. DIMER OF A HEAVY C. SUBUNIT: MYOSIN I HEAVY CHAIN: IS SINGLE-HEADED. DIMER OF A HEAVY C. I. SUBUNIT: MYOSIN I HEAVY C. AND ALIGHT CHAIN. TO PROFILE MYOSIN I CAN THEREFORE MOVE ACTIN RELACHS CONFIDED MEMBRANES.

C. I. DOMAIN: TH. BINDS DIRECTLY TO ANIONIC PHOSPHOLIPID MEMBRANES.

C. I. DOMAIN: THO SINGLE MOVE ACTIN RELACH SINGLE MOLECULES.

THE NUCLEOTIDE-SENSITIVE SITE IN THE HEAD, ALLOWS SINGLE MOLECULES.

THE NUCLEOTIDE-SENSITIVE SITE IN THE HEAD, ALLOWS SINGLE MYOSIN I TO CROSS-LINK ACTIN ELAST THREE ISOFORMS OF MYOSIN I THORWAY.

C. I. SIMILARITY: COMPAINS 1 MYOSIN-LIKE GLOBULAR HEAD DOMAIN.

C. I. SIMILARITY: COMPAINS 1 SH3 DOMAIN.

C. I. CAUTION: MAS ORIGINALLY THOUGHT TO BE MYOSIN IB.

Single-strand binding protein (SSB) (Helix-destabilizing protein).
SSB OR ML2684 OR MLCB1913.20C.
--- FUNCTION: INSULIN DECREASES BLOOD GLUCOSE CONCENTRATION. IT INCREASES CELL PERMEABILITY TO MONOSACCHARIDES, AMINO ACIDS AND FATTY ACIDS. IT ACCELERATES GLYCOLYSIS, THE PENTOSE PHOSPHATE CYCLE, AND GLYCOGEN SYNTHESIS IN LIVER.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MEDILTON-21128732; PubMed=11234002;

                                                                                                                                                                                                                SIMILARITY).
--- SIMILARITY: BELONGS TO THE STRIATIN FAMILY OF WD-REPEAT PROTEINS.
--- SIMILARITY: COWTAINS 7 WD REPEATS (TRP-ASP DOMAINS).
--- CAUTION: The name "Zinedin" probably originates from the name of the famous soccer player from Marseille (Zinedine Zidane)!
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

            A1, A2, A3, A4, AND EMBRYO-SPECIFIC ISOFORMS E1, E2 AND E3 (SHOWN FIRE); ARE PRODUCED BY ALTERNATIVE SPLICING.
-!- DEVELOPMENTAL STAGE: EXPRESSED IN BABRYOS OF BATH SEXES. ALSO EXPRESSED IN THE PRODUCENTYOR CELLS OF THE GENMLINE.
-!- SIMILARITY: CONTAINS 2 RNA RECOGNITION MOTIFS (RRM).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Theil T., Zechner U., Klett C., Adolph S., Moeroey T.; "Chromosomal localization and sequences of the murine Brn-3 family of developmental control genes.".

-!- SUBUNIT: HETEROTETRABER OF TWO TYPE I AND TWO TYPE II KERATINS.

-!- SUBUNIT: HETEROTETRABER ASSOCIATED WITH KERATIN 1.

-!- MISCELLANEOUS: THERE ARE TWO TYPES OF CYTOSKELETAL AND

MICROFIBRILLAR KERATIN, I (ACIDIC) AND II (NEUTRAL TO BASIC)

MICROFIBRILLAR KERATIN, I (ACIDIC) AND II (NEUTRAL TO BASIC)

-!- SIMILARITY: BELONGS TO THE INTERMEDIATE FILAMENT FAMILY.
                                                                                                                                                                                                                                                                                                                                                Steinert P.M., Rice R.H., Roop D.R., Trus B.L., Steven A.C.; "Complete amino acid sequence of a mouse epidermal keratin subunit and implications for the structure of intermediate filaments."; Nature 302:794-800(1983).
